

Cable Insulator

JEWEL CableLifter

The energy balance is well-balanced and the outlook is improved.

Text: Masanori Hayashi

Attention point: Born from the idea unique to a manufacturer who knows all about cables. Especially effective with heavy cables can be expected!

JEWEL is a new brand of American audiences familiar with high-end audio cables and loudspeakers. Cable Lifter is coming out as the first work. It's just a jewel. It is a high-end cable insulator that is elegantly finished with transparent acrylic resin. The size is 50 mm square. With a groove width of 25 mm and a considerable weight of 280 g, it will be particularly suitable for use with heavy cables. It doesn't slip with a little force. The advantage is that stable installation conditions can be obtained.

The texture is strangely "hard and soft", but the corners are carefully polished to remind you of crafts. The body looks blue due to the light, and the gold letters of "audience" pop up!

The use is versatile. First of all, if you use it with a power cable and then a speaker cable, the energy balance will be adjusted and the visibility to the midrange such as vocals will be dramatically improved. The bottom of jazz is fulfilling, and the drums and bass are tight. The line cable and USB cable also suppress minute vibrations and improve the quality in all areas such as resolution and spatiality.

36,000 yen for a set of 4 pieces. Although it is expensive, it is attractive that it is good to see and use and is extremely satisfying.
